iLase™

For Oral Surgery and Periodontal Treatment

The iLase™ Laser System

Safe. Fast. Simple.

Why iLase™ laser treatment?

No one wants surgery!

But when surgery is required, conventional treatments utilizing a scalpel and sutures can cause a great degree of discomfort.

iLase laser treatments provide patients with greater comfort, less bleeding, faster healing and better clinical results than conventional treatments.

What laser treatments can the iLase laser do?

The iLase laser system is indicated to treat your gums or any other soft tissue in your mouth:

Improve “Gummy” Smile

The iLase laser system improves the appearance of your smile by contouring or shaping the gums by safely removing excess gum tissue that may give you a “gummy” smile, or make your front teeth appear irregular in size or shape.

Remove Traumatic Oral Growths

The iLase laser system may be used to remove small “tags” called papillomas and growths called fibromas, that result from cheek or tongue traumatic bite.

Fix “Tongue Tie” or Prevent Gum Recession

Tissue connections that restrict the movement of your tongue or cause gums recession can be “released” with the iLase laser. Patients with tongue tie will experience speech improvement after the iLase laser treatment.

Treat Gum Disease

Bleeding gums and gum recession are common signs of gingivitis and gum disease, caused by the presence of bacteria and inflammation inside the gums. The iLase laser gum treatment is a painless procedure that removes inflammatory debris and infected tissue from inside the gums. Improved healing of the gum tissue follows after this treatment along with proper oral care.

Relieve the Pain of Cold Sores and Fever Blisters

The iLase laser treatment provides immediate relief from painful cold sores and fever blisters after a single application.

Your dentist or hygienist will provide required laser protective eyewear.

How does the iLase laser system work - is it safe?

BIOLASE Technology developed the iLase laser system, a diode laser that performs many procedures requiring minor oral surgery and gum treatments.

Through its completely wireless, portable handpiece, the iLase laser system emits a concentrated light that precisely interacts with the areas to be treated in a low dose and safe manner. It can also provide temporarily relief of pain and inflammation simply by delivering therapeutic heat.
